

1) Concept map: lower bound of an algorithm

Explanation:-

- 1, how the lower bound is determined
 - The lower bound is the minimum amount of time or operations an algorithm must perform to solve a problem.
 - It is usually determined through the best-case analysis, where the algorithm receives the most favourable input.

2, minimum performance

- shows the least work the algorithm performs in the worst case.

3, Input conditions:-

- best-case input gives the lowest execution time.

4) Importance of best-case Analysis:-

- Shows the maximum efficiency of an algorithm
- helps identify the maximum possible execution time.

- helps identify

Contribution :-

• Along with average and worst case, it gives a complete understanding of an algorithm's behaviour
